

Vector Shape Shift

Move among component, linear, and trigonometric forms.

HIGH SCHOOL • MA.912.NSO.3.2

MA.912.NSO.3.2 "Represent vectors in component form, linear form or trigonometric form. Rewrite vectors from one form to another."

NAME _____

DATE _____

THREE VECTOR FORMS

In component form, $\langle a, b \rangle$ matches linear form $ai + bj$. To write trigonometric form, find $r = \sqrt{a^2 + b^2}$, then use $r(\cos \theta i + \sin \theta j)$, where θ is measured counterclockwise from the positive x-axis.

WORKED EXAMPLE

Rewrite $\langle 9, 40 \rangle$ in linear form and trigonometric form.

1. Linear form: $9i + 40j$.
2. Find the magnitude: $\sqrt{9^2 + 40^2} = \sqrt{1681} = 41$.
3. The vector is in Quadrant I, so $\theta = \tan^{-1}(40/9)$.
4. Trig form: $41(\cos \theta i + \sin \theta j)$.

Answer: $9i + 40j$; $41(\cos(\tan^{-1}(40/9))i + \sin(\tan^{-1}(40/9))j)$

PRACTICE 6 problems

1 Rewrite $\langle 6, -8 \rangle$ in linear form.

ANSWER _____

2 Rewrite $-11i + 14j$ in component form.

ANSWER _____

3 Rewrite $12(\cos 30^\circ i + \sin 30^\circ j)$ in linear form.

ANSWER _____

4 Rewrite $16(\cos 120^\circ i + \sin 120^\circ j)$ in component form.

ANSWER _____

5 Rewrite $\langle -7, 24 \rangle$ in trigonometric form.

ANSWER _____

6 Rewrite $20(\cos 225^\circ i + \sin 225^\circ j)$ in linear form.

ANSWER _____

APPLY IT Show your work

- 1** During a drone club test, a drone flies 16 meters at a direction angle of 210° from east. Write its displacement in linear form, where i points east and j points north.

WORK SPACE

ANSWER _____

- 2** A video crew's map uses i for east and j for north. A camera cart moves $-20i + 21j$ meters. Write the displacement in trigonometric form.

WORK SPACE

ANSWER _____

CHALLENGE One step up

CHALLENGE

Let $u = 8(\cos 60^\circ i + \sin 60^\circ j)$ and $v = -4i + 4\sqrt{3}j$. Find $u + v$ in component form, linear form, and trigonometric form.

PART 1 • PRACTICE

#	PROBLEM	ANSWER
1	Rewrite $\langle 6, -8 \rangle$ in linear form.	$6i - 8j$
2	Rewrite $-11i + 14j$ in component form.	$\langle -11, 14 \rangle$
3	Rewrite $12(\cos 30^\circ i + \sin 30^\circ j)$ in linear form.	$6\sqrt{3}i + 6j$
4	Rewrite $16(\cos 120^\circ i + \sin 120^\circ j)$ in component form.	$\langle -8, 8\sqrt{3} \rangle$
5	Rewrite $\langle -7, 24 \rangle$ in trigonometric form.	$25(\cos(180^\circ - \tan^{-1}(24/7))i + \sin(180^\circ - \tan^{-1}(24/7))j)$
6	Rewrite $20(\cos 225^\circ i + \sin 225^\circ j)$ in linear form.	$-10\sqrt{2}i - 10\sqrt{2}j$

PART 2 • APPLY IT

- $-8\sqrt{3}i - 8j$ meters** Use $\cos 210^\circ = -\sqrt{3}/2$ and $\sin 210^\circ = -1/2$, then multiply both values by 16.
- $29(\cos(180^\circ - \tan^{-1}(21/20))i + \sin(180^\circ - \tan^{-1}(21/20))j)$ meters** The magnitude is $\sqrt{(-20)^2 + 21^2} = 29$. The vector is in Quadrant II, so $\theta = 180^\circ - \tan^{-1}(21/20)$.

CHALLENGE

Component form: $\langle 0, 8\sqrt{3} \rangle$; **linear form:** $8\sqrt{3}j$; **trigonometric form:** $8\sqrt{3}(\cos 90^\circ i + \sin 90^\circ j)$

Accept equivalent exact forms and coterminal direction angles in trigonometric answers. Accept 90° plus any whole-number multiple of 360° for the challenge direction angle.
