

Wave Equation Builder

Build sine and cosine models from periodic features.

HIGH SCHOOL • AII-F.TF.5

AII-F.TF.5 "Choose trigonometric functions to model periodic phenomena with specified amplitude, frequency, horizontal shift, and midline."

NAME _____

DATE _____

BUILD THE MODEL

Use $y = A \sin(2\pi f(x - h)) + k$ or $y = A \cos(2\pi f(x - h)) + k$. The amplitude is $|A|$, f is the frequency in cycles per unit, h is the horizontal shift, and k is the midline. Choose sine when a midline crossing is useful, or cosine when a maximum or minimum is useful.

WORKED EXAMPLE

Write a sine model with amplitude 11, frequency $1/9$ cycle per unit, a shift right 2 units, and midline $y = -4$.

1. Start with $y = A \sin(2\pi f(x - h)) + k$.
2. Use $A = 11$, $f = 1/9$, $h = 2$, and $k = -4$.
3. Compute $2\pi f$: $2\pi(1/9) = 2\pi/9$.
4. Substitute the values into the model.

Answer: $y = 11 \sin((2\pi/9)(x - 2)) - 4$

PRACTICE 6 problems

- 1** Write a sine model with amplitude 3, frequency $1/5$ cycle per unit, a shift right 1 unit, and midline $y = 7$.

ANSWER _____

- 2** Write a cosine model with amplitude 14, frequency $1/6$ cycle per unit, a shift left 3 units, and midline $y = -1$.

ANSWER _____

- 3** For $y = -8 \sin(10\pi(x - 4)) + 7$, state the amplitude, frequency, horizontal shift, and midline.

ANSWER _____

- 4** A cosine model has a minimum of -3, a maximum of 13, a period of 12 units, and a maximum at $x = 6$. Write the model.

ANSWER _____

- 5** Write a sine model with amplitude 15, period 14 units, midline $y = -5$, and a midline crossing that rises at $x = 3$.

ANSWER _____

- 6** Choose the model with amplitude 13, frequency $1/4$ cycle per unit, a shift left 5 units, and midline $y = 6$. A. $y = 13 \cos((\pi/2)(x + 5)) + 6$ B. $y = 13 \cos((\pi/4)(x + 5)) + 6$ C. $y = 13 \cos((\pi/2)(x - 5)) + 6$ D. $y = 6 \cos((\pi/2)(x + 5)) + 13$

ANSWER _____

APPLY IT Show your work

- 1** A video game's screen glow has a brightness that ranges from 44 to 80 units. It repeats every 8 seconds and is brightest when $x = 0$. Write a cosine model $B(x)$ for the brightness.

WORK SPACE

ANSWER _____

- 2** In an audio-editing app, a sound signal ranges from -5 volts to 5 volts and repeats 2 times each second. The signal is at a maximum when $x = 1/8$ second. Write a cosine model $S(x)$ for the signal.

WORK SPACE

ANSWER _____

CHALLENGE One step up

A motion sensor's reading has a minimum of -3, a maximum of 13, and a period of 6 seconds. At $x = 1$ second, the reading crosses its midline while decreasing. Write a sine model $M(x)$, then explain why the sine coefficient must be negative.

WORK SPACE AND ANSWER

PART 1 • PRACTICE

#	PROBLEM	ANSWER
1	Write a sine model with amplitude 3, frequency $1/5$ cycle per unit, a shift right 1 unit, and midline $y = 7$.	$y = 3 \sin((2\pi/5)(x - 1)) + 7$
2	Write a cosine model with amplitude 14, frequency $1/6$ cycle per unit, a shift left 3 units, and midline $y = -1$.	$y = 14 \cos((\pi/3)(x + 3)) - 1$
3	For $y = -8 \sin(10\pi(x - 4)) + 7$, state the amplitude, frequency, horizontal shift, and midline.	amplitude = 8; frequency = 5 cycles per unit; shift right 4 units; midline $y = 7$
4	A cosine model has a minimum of -3, a maximum of 13, a period of 12 units, and a maximum at $x = 6$. Write the model.	$y = 8 \cos((\pi/6)(x - 6)) + 5$
5	Write a sine model with amplitude 15, period 14 units, midline $y = -5$, and a midline crossing that rises at $x = 3$.	$y = 15 \sin((\pi/7)(x - 3)) - 5$
6	Choose the model with amplitude 13, frequency $1/4$ cycle per unit, a shift left 5 units, and midline $y = 6$. A. $y = 13 \cos((\pi/2)(x + 5)) + 6$ B. $y = 13 \cos((\pi/4)(x + 5)) + 6$ C. $y = 13 \cos((\pi/2)(x - 5)) + 6$ D. $y = 6 \cos((\pi/2)(x + 5)) + 13$	A. $y = 13 \cos((\pi/2)(x + 5)) + 6$

PART 2 • APPLY IT

- $B(x) = 18 \cos((\pi/4)x) + 62$** The amplitude is $(80 - 44)/2 = 18$ and the midline is $(80 + 44)/2 = 62$. A period of 8 gives a frequency of $1/8$, so the coefficient is $2\pi(1/8) = \pi/4$.
- $S(x) = 5 \cos(4\pi(x - 1/8))$** The amplitude is 5 and the midline is 0. A frequency of 2 gives coefficient $2\pi(2) = 4\pi$, and cosine reaches a maximum at its horizontal shift.

CHALLENGE

$M(x) = -8 \sin((\pi/3)(x - 1)) + 5$. The amplitude is 8, the midline is 5, and the frequency is $1/6$. A negative sine coefficient makes the graph cross the midline downward at $x = 1$.

Accept algebraically equivalent models, including sine or cosine models with an equivalent phase shift. Amplitude should be reported as a positive value, even when the sine or cosine coefficient is negative.
